

Additional Info on the use of Saliva Test Kits

1. CNB has enhanced its drug testing capabilities to detect and deter drug consumption, both locally and overseas. Saliva test kit has been deployed at checkpoints and during inland enforcement operations to augment drug detection efforts and improve our operational effectiveness.
2. Saliva testing offers a quick, portable and non-invasive mean of drug consumption testing via oral fluid. With a short turnaround time of an average of 10 minutes, the on-site preliminary screening tool will aid officers in their operational assessment of potential drug abuse. Those tested positive will be subjected to further investigations. This additional testing method will complement and enhance CNB's current drug detection capabilities.
